

Prim's Algorithm

→ Find minimum spanning tree in a graph.

→ Minimum Spanning Tree (MST)

- Subset of a graph that connects all the vertices with minimum possible edge weight.

Eg:

How to solve using PRIM

1. Select one vertex and explore all the adjacent node.

- Select A:

Adjacent nodes

A → B : 2 ✓

A → F : 3

A → D : 5

→ Select the minimum weight edge.

→ repeat for all the nodes.

Final Spanning Tree.
